Data Transformation Note:

I collected precipitation data for Phoenix, Arizona from five separate data sets and combined them into one table so the results from each dataset could be viewed next to one another. I then totaled the results from each dataset for further comparison.

Data Story

Arizona Precipitation

Write a 75-150 word introduction that establishes the question or claim and why it matters.

D1 • Story Frame

The state of Arizona has an arid climate and experiences regular sunshine for most of the year. Although higher elevations have increased chances of precipitation year-round, statewide the precipitation totals in Arizona are low in relation to the rest of the United States. The National Oceanic and Atmospheric Administration, or NOAA, maintains records of global climatological data including precipitation totals in the state of Arizona. Utilizing data collected from NOAA, meteorologists can observe visible trends in precipitation from year-to-year to better prediction models for the future. From this data, they can find out which months, quarters, or seasons in the year are the wettest and dryest. The data represented in this article focuses specifically on quarterly measurements in Phoenix, Arizona.

D2 • Editorial Figures

Code Defense

When validating my index.html file with the Nu HTML Checker at <https://validator.w3.org/nu/#file>, there was an error with the table elements that were in the <tfoot> container. I had listed a <th> followed by five <td> but I had forgotten to wrap them in a <tr> container first per MDN guidelines on <https://developer.mozilla.org/en-US/docs/Web/HTML/Reference/Elements/table>. To correct this, I added a <tr> container and placed the <th> and <td> elements within it. I then revalidated the index.html file to verify the problem was fixed and the check returned no errors.
